

# Peer-to-Peer Book Exchange

Supervisor: Binglan Han (b.han1@massey.ac.nz)

## Project Overview:

Purchasing textbooks and academic materials can be costly for students, and many end up with unused books after a semester. This project involves building a responsive, easy-to-use **Peer-to-Peer Book Exchange** web application that enables students to buy, sell, or exchange textbooks and other study materials directly with their peers.

The platform will offer a searchable listing of available items, categorized by course, subject, or material type. Students can post listings with item details and images, communicate through a built-in chat system, and arrange exchanges or purchases. Administrators will have moderation capabilities to ensure appropriate use of the platform.

This project combines core full-stack web development skills with marketplace functionality, giving you practical experience in building real-world, user-driven applications.

## Target Users:

- University Students
- Book Buyers and Sellers
- Campus Administrators (with moderation access)

## Core Functional Requirements:

### Listings System:

- Ability for students to create listings for textbooks or academic materials
- Listings include title, description, price, condition, and images
- Categorization by course, subject, and material type

### Search & Filter Features:

- Search by keyword, course, subject, or price range
- Filter results based on item condition or availability

## **Communication System:**

- In-app chat feature to facilitate negotiations between buyers and sellers
- Option to share contact details privately

## **Transaction History:**

- Users can view their listing history and transaction status
- Records of completed purchases or exchanges

## **Admin Moderation Panel:**

- Admin login for authorized personnel
- Ability to review, approve, or remove listings
- Manage reported users or inappropriate content

## **Other Features:**

- Rating and review system for sellers and buyers
- Recommendation engine suggesting relevant listings based on user interests
- Payment integration for seamless transactions (optional)

## **Technology Stack:**

Determine the technology stack required for the development of the online exchange application, considering factors such as scalability, performance, security, and compatibility with web and/or mobile platforms. Consider the development team's expertise.

## **Expected Deliverables:**

- Fully functional web application with book exchange features
- Admin management panel for listing moderation
- Clean, mobile-responsive user interface
- Documentation:
  - Project Report with technical details
  - Database schema diagram
  - API documentation (if applicable)
  - Source code managed via Git and collaborative version control
- Final presentation and live demo
